

Dear All,

## Crimps II (Belt & Braces)

If you cast your mind back to Issue one, we advised you that we recommended using crimps on your hoses. This was after some pressure from a couple of clients preferring the method.

Over the last few weeks we have had a couple of hoses blow off gas guns as a result. So, we now advising you to use both crimps *and* jubilee clips, as a backup.

## Start Right!

(daily safe start)

Most, if not all of the sites that we work on have a Start Right or Daily Safe Start briefing in place. These are vitally important as they highlight daily changes in site conditions that may be vital in your evacuation from site in an emergency or your general safety whilst working day to day.

Supervisors are required to attend these and all workers are required to be subsequently briefed by the GA supervisor.

If the site you are working on doesn't have a Start Right or daily safe start you must complete the G.A form supplied in the site file.

The majority of you have completed the Asbestos Awareness course, so you should be aware of what to do if you come across this potentially lethal substance, but in case you haven't, or need reminding, here's a reminder:

If you discover anything that appears to contain fibrous material whether this be in a tile, sheet or of a woollen nature, or if you are at all unsure, please STOP WORK and immediately contact your supervisor or site agent. DO NOT disturb the material whatsoever until it has been deemed safe to do so.

If you haven't been on an Asbestos Awareness course, please contact Gregg Ellis.

If anyone has a health & safety concern or something to contribute to our newsletter, please feel free to speak to Gregg Ellis on 07956 235880.
